CAT STEELMANAGER

Quality, Traceability and Certification

If you've been in the business for any time, you'll know that quality-assurance requirements today are much more stringent than they were yesterday, and you'll probably be able to predict confidently that they'll be even more stringent tomorrow. Many of the requirements are routine, but they all take time, and are all prone to human error. That's why allowing your computer-system to check as much as possible is such a good idea. And if you think that the list below offers far more than you need now, be reassured that it's all individually configurable on or off, and that you are prepared and can turn it on when a customer imposes a new requirement on you next week.

Key Features

- Complete batch traceability from supplier to customer via whatever stocking and engineering processes have been applied.
- Check chemistry and mechanical-properties against your buying-specs at goods-receipt.
- Check chemistry and mechanical-properties against customers' specs as you allocate material to a sale and also at other significant events – you might, after all, be changing material properties by heat-treatment or cold-working for example.
- Record significant documents in our document-management system – see separate eDocs page; the list is endless: original mill-certs, suppliers' advice-notes, UT reports, furnace-charts, testhouse certificates, etc; any or all are then available for all staff to check or print, and are ready to be added to the document-pack that will accompany your advice-note to a customer.
- Generate your own certification, ranging from a simple certificate of conformity through printing casts' analysis to the foot of advice-notes to a full test-cert recording room-temperature and elevated tensile results, room-temperature and sub-zero impacts, ultrasonics, crack-detects and more.
